

Towards bridging the genotype-phenotype gap

systems level dissection of the impact of variation in DNA
sequence and structure on gene expression

Teresa Przytycka
NIH / NLM / NCBI

- association

- association 
- specific gene / mutation
- Mechanism of action
- Effect on other molecules/pathways?
- Complexity of phenotypes
- epistatic effects

Impact of variations in DNA/RNA sequence and structure on gene expression and function

- Conformational changes in DNA structure
- Conformational changes in RNA structure

Propagation of genetic perturbations through the molecular system

- Propagation of the effect of copy number variations
- Identification of pathways dys-regulated in cancer
- Identification of “causal” genes

Uncovering epistatic interactions

- Identification of epistatic interactions involved in drug resistance

Conformational changes of DNA structure

Z-DNA-forming silencer in the first exon regulates human ADAM-12 gene expression

Bimal K. Ray, Srijita Dhar, Arvind Shakya, and Alpna Ray¹

Department of Veterinary Pathobiology, University of Missouri, Columbia, MO 65211

Edited* by Alexander Rich, Massachusetts Institute of Technology, Cambridge, MA, and approved November 19, 2010 (received October 1, 2010)

Detecting Non-B DNA structures in *vivo*

Detecting Non-B DNA structures in *vivo*

melted DNA (SIDD)

Z-DNA

cruciform

G-quadruplex

H-DNA

Detecting unpaired bases: ssDNA - Seq

Single stranded
DNA fragment

...
Sequencing of adjacent
DNA fragments

Mapped reads

Detecting Non-B DNA structures in *vivo*

A+T rich sequence

melted DNA (SIDD)

$(YR \cdot YR)_n$

Z-DNA

cruciform

Single stranded
DNA fragment

...
Sequencing of adjacent
DNA fragments

Mapped reads

Detecting unpaired bases:
ssDNA - Seq

ssDNA (SIDD site)

$(Y \cdot R)_n$ mirror repeats

H-DNA

G-quadruplex

$(G)_n$ tracts

inverted repeats

Specific non-B DNA structures are accompanied by specific tag distribution

melted DNA (SIDD)

Z-DNA

cruciform

G-quadruplex

H-DNA

Expected tags distribution for SIDD

Specific non-B DNA structures are accompanied by specific tag distribution

SIDD-signature

Specific non-B DNA structures are accompanied by specific tag distribution

Z-DNA-signature

Summary –

- Enrichment of ssDNA-seq in predicted non-B-DNA structures
- Consistency of tag distribution with theoretical predictions

suggests (abundant) occurrence of non-B DNA structures *in vivo*

Questions

- What is their role, mechanism, interaction with other regulatory elements and Pol II activity

Conformational changes in mRNA structure induced by SNPs

Special acknowledgments: *Raheleh Salari*

Motivation:

- 5'UTR mRNA structure has regulatory role
- Impact of mRNA structural changes in coding region
 - possible impact on splicing
 - changes in translation dynamics leading to altered folding kinetics of nascent protein chain, and potentially protein misfolding

Computational estimation of the impact of a SNP on mRNA structure

p – assembly structures assumed by wild type:

**Minimum free energy
structure**

*(area of a circle ~
probability of the structure)*

Computational estimation of the impact of a SNP on mRNA structure

assembly structures assumed by wild type

assembly of structures assumed by mutant

Need to compare assemblies of structures taking into account the probability of each structure

Measures for comparing of assemblies of structures

p – probability distribution for the assembly of structures assumed by wild type

q – probability distribution of the assembly of structures assumed by the mutant

(a) Relative entropy

$$H(p\|q) = \sum p_s \log(p_s/q_s)$$

(b) Boltzmann distribution distance

$$d_B(p, q) = \frac{1}{Z_a + Z_b} \sum |e^{-E_{sa}/RT} - e^{-E_{sb}/RT}|$$

(c) Base pair probability distance

$$d_{BP}(p, q) = \frac{1}{n} \sum_{i < j} p_{ij} + q_{ij} - 2p_{ij}q_{ij}$$

Algorithm using the dynamic programming approach

Disease associated SNPs with significant changes in 5'UTR of mRNA structure

| HGMD_ID | gene | type | SNP | Relative Entropy | Boltzmann | BP distance | Disease association |
|----------|-------|------|-------|------------------|-----------|-------------|--|

Can structural changes in mRNA explain disease associated silent SNPs ?

Disease associated “silent SNPs” change mRNA structure:

Collaboration with *Andy Fung* (*Michael Gottesman’s* group, CCR)

Disease causing silent mutations in **MDR1** gene

A Silent Polymorphism in the *MDR1* Gene Changes Substrate Specificity –

C. Kimchi-Sarfaty et al. Science 2006

Collaboration with *Chava Kimichi-Sarfaty* (FDA)

Disease associated silent mutation in **F9** - coagulation factor IX gene

Summary - Efficient computational method to measure effect of SNPs on mRNA allows us to identify disease associated SNPs that have impact mRNA structure

Impact of variations in DNA/RNA sequence structure on gene function

How genetic variations propagate through the molecular system?

Combinatorial regulation and epistatic interactions

Copy number variations (CNV) (gene dosage)

- implicated in large number of human diseases (cancer, Crohn's disease, autism)
- 28,025 structural variants identified in 1000 genome study (2,000 changes affecting full genes or exons)
- Frequent type of somatic mutations in cancer

Impact of gene dosage on gene expression (*Drosophila melanogaster*)

collaboration with *Brian Oliver* group (NIDDK)
Special acknowledgments:
John Malone, DongYeon Cho

Expression fold change (\log_2)

Expression (wild type)

Impact on genes outside the deletions

Fly functional network from Costello et.al GB 2009

Impact on genes outside the deletions

Fly functional network from Costello et.al GB 2009

Genes which show drastic changes due to reduced gene dosage are much more likely to see expression changes for 1st order network neighbors

one copy genes:
● over compensated
● fully compensated
● partially compensated
● not compensated
● anti compensated

Summary:

Copy number variations impact expression of genes outside deletion in network-dependent way

Indication of feedback loops acting on deleted genes

Propagation of the effects of CNV in Glioma

Special acknowledgments:
Yoo-ah Kim

Motivation:

- A method for system level analysis of propagation of such perturbation in the network
- Identification pathways dys-regulated in disease
- Capturing master regulators (network hubs) involved in disease
- Identification “causal” mutations

Propagation of the effects of CNV in Glioma

| JAK-STAT cascade | 2 |
| regulation of transforming growth factor-beta2 production | 2 |
| G1/S transition of mitotic cell cycle | 2 |
| SMAD protein nuclear translocation | 2 |

Advantages of current flow approach

- Ability to use expression to guide the flow of information
- **Efficiently solvable** by solving a set of linear equations (Kirchhoff's laws)
 - Caveat:** solving a linear system with 20,000 variables thousands of times (permutation test !) required new methodology

Kim, Przytycki, Wuchty, Przytycka – *Phys. Bio.* – in print

- Extendable to directed edges
- The first approach that addresses the question of relation between CNV and dys-regulated genes/pathways identifying common dys-regulated pathways and causal genes
